

*i*SB-HA

No Switch HA

HA data protection for the IBM *i*

Have you ever had an application that had to be up all the time? Power HA and Software replication failovers are too slow?

*i*SB-HA has designed No Switch HA (*NSHA*).

NSHA using *i*SB-HA keeps 2 or more partitions in sync, not matter which one of the partition is receiving user changes.

NSHA isn't for every HA installation. There are limits on the type and number of objects that can be included. But for an application with a limited number of files

No Switch HA

provides Real Time data replication to 2 or more partitions where any partition can act as the production and *i*SB-HA will keep the other partitions in-sync.

Don't wait, call today

*i*Sam Blue, llc

Data Protection is all we do!
